

A provisional inventory of vascular plants for the Sefton Coast

Philip H. Smith, February 1999

Introduction

The idea for this study surfaced during research for a book on the Sefton Coast sand-dunes (Smith in press). It was found that the most recent vascular plant inventory for this area was that of Rooney (1993). He had listed 530 taxa. However, this was based largely on a compilation of 446 plants for the Ainsdale Sand Dunes National Nature Reserve (NNR) (Payne 1982) and was not representative of the whole coast. For example, Gateley (1987) recorded 314 vascular plants at Cabin Hill NNR, 46 of which were not on Rooney's list. I also knew of many additional species from my own studies.

Current field work for the Botanical Society of the British Isles (BSBI) Atlas Survey, together with other recent studies for the Sefton Coast Life Project (1994-1999), provided a unique opportunity to compile an up-to-date inventory of higher plants (i.e. flowering plants, conifers and ferns) reliably identified on the Sefton Coast. It was hoped that this would contribute to an understanding of the outstanding biodiversity of this internationally important region.

Methods

After consultation, it was decided to define boundaries of the study areas as follows :

1. The Sefton Coast Management Scheme area (8840ha), as mapped in the Coast Management Plan (Sefton MBC 1997). This extends from Bootle Docks to Crossens and includes the reclaimed land of Seaforth Nature Reserve and Crosby Marine Park, together with tidal salt-marsh and embanked grazing marshes at Marshside and Crossens, as well as the coastal dune system. I also decided to include a sandy field near Hightown east of the railway (SD 303026) which is not, at present, within the remit of SCMS but, following survey, may be considered for inclusion under the terms of the Coast Management Plan (*loc. cit.*), in addition to other sites on blown sand to the east of Formby.
2. The Sefton Coast sand-dune system (2078ha), as defined by Edmondson, Gateley & Nissenbaum (1988/89) in their National Vegetation Classification survey of the dune coast. I added Hesketh Golf Course and the Hightown field mentioned above to the mapped boundary in their report.
3. The candidate Special Area of Conservation (4098ha), selected in 1996 under the EU Habitats Directive. The boundary defined in the Coast Management Plan (*loc. cit.*) includes a large inter-tidal zone, the coastal SSSIs, with the exception of Hesketh Golf Course and Freshfield Dune Heath SSSIs, and the two NNRs south of Southport Pier,

I consulted as wide a range as possible of published and unpublished literature on plants of the coast, the starting point being *Travis's Flora of South Lancashire* (Savidge, Heywood & Gordon 1963). The BSBI Recorder for South Lancashire, Peter Gateley, kindly provided hard copies of relevant tetrad lists from the Atlas Survey. However, some tetrads contain "non-coastal" habitats so care had to be taken to exclude, as far as possible, plants not found within the defined study areas. In some cases, this necessitated consultation with the original recorder. I also made use of the Joint Countryside Advisory Service data-base on Sites of Local Biological Interest, the Resource Centre

established by the Sefton Coast Life Project and my own reports of survey. All sources are referenced at the end of this report.

I listed all vascular (ferns, conifers and flowering plants) species, sub-species and hybrids, but not varieties, found growing as native plants or naturalised introductions. The latter included well established garden-escapes but not recent amenity plantings. In addition, it was decided to specify, largely on the basis of Savidge, Heywood & Gordon's (1963) findings, those species now considered to be extinct in the area. There are also a few old records, published in the same work, of taxa apparently not seen since at least the early 1960s. The latter were carefully screened so that only taxa attributed to particular sites within the defined study areas were listed. All other records were of recent (i.e. post-1980) identifications, a number being additional to those listed by Savidge, Heywood & Gordon (1963). Nomenclature follows the *New Flora of the British Isles* (Stace 1991).

Results

A total of 971 taxa was recorded in the SCMS area, 881 (90.7%) in the sand-dune system and 733 (75.5%) in the candidate Special Area of Conservation (Table 1). The much lower figure for the cSAC is probably due to the fact that some coastal habitats, particularly dune heath, are poorly represented in this area.

Of the grand total, 855 (88.0%) are full species, 49 (5.0%) sub-species and 67 (6.9%) hybrids. Some 290 taxa (29.9%) were considered to be introduced (Table 1). Interestingly, the percentages of introduced taxa in the dune area (27.1) and in the cSAC (21.6) were considerably lower than within the SCMS area (Table 1). A likely explanation is that the SCMS area includes more ruderal habitat, such as the Seaforth area and the Marshside coastal road embankment, as well as dune margins adjacent to built development. Such areas would be expected to support many more aliens, including garden escapes, than the core of the dune system

All plants are listed in alphabetical order of scientific names in Appendix 1. A high proportion of the taxa was recorded recently, only 26 (2.7%) being "old" records as defined above and therefore possibly extinct (Table 3). In addition, only 14 taxa (1.4%) are considered to be almost certainly extinct (Table 2), 13 of these having been specified as such in *Travis's Flora*, the other (*Cotula coronopifolia*) being lost from the area more recently. More than balancing these losses are 36 native taxa recorded for the first time in the coastal area during the past 30 years or so (Table 4). This figure does not, however, include the large number of alien plants, especially garden escapes, and several *Rubus* microspecies noted during recent surveys.

Some of the large genera are particularly well represented in the study areas, with 19 taxa of *Carex*, 8 of *Hieracium*, 17 of *Juncus*, 31 of *Rubus*, 23 of *Salix* and 16 of *Veronica*. In the case of *Salix* (willows), a total of 10 species and 13 hybrids has been identified, several of the latter being extremely rare nationally. No attempt has been made to assess the status of the recorded taxa within the SCMS area, though this would be a useful future exercise as it would help to target plants in need of special conservation attention.

A project such as this can never be considered complete and the author would welcome new records to add to the inventory.

Acknowledgements

This study would not have been possible without the dedicated efforts of many field botanists who have recorded their observations over recent years. The names of M.K. Brummage, D.P. Earl, Ms S.E. Edmondson, P.S. Gateley, Ms V. Gordon, Ms P. Lockwood, Ms D.A. Nissenbaum, P.W. Sturgess and D. Wrench particularly come to mind. Grateful thanks are also due to A. Baker, Ms C.M. Bennett, D.P. Earl, P.S. Gateley, M. Gee and S.J. White for much detailed information and to the Sefton Coast LIFE team, Ms R. Flannery, J. Houston, P. Rooney, D.E. Simpson and D. Wrench, for support, encouragement and practical assistance in the production of this report.

Table 1. Summary of data from the provisional vascular plant inventory of the Sefton Coast

	SCMS area	Sand-dunes	cSAC
Total number of taxa	971	881	733
No. of species	855	780	651
No. of sub-species	49	44	38
No. of hybrids	67	57	44
Introduced taxa	290	239	158
% of introduced taxa	29.9	27.1	21.6
Extinct taxa	14	12	6
Old (pre-1963) records	26	25	16
Recent (post 1980) records	931	844	711
Recent records not seen before 1963 (native taxa) 36	34	21	

Table 2. Vascular plants considered to be extinct on the Sefton Coast.
(Introduced taxa indicated with an asterisk)

Species	Last recorded
<i>Anagallis minima</i> Chaffweed	1955, Ainsdale
<i>Antennaria dioica</i> Mountain Everlasting	1954/55, Ainsdale & Freshfield
<i>Arabis hirsuta</i> Hairy Rock-cress	pre-1900, Formby, Crosby, Bootle
<i>Centaurium latifolium</i> Broad-leaved Centaury	1872, Freshfield
<i>Coeloglossum viride</i> Frog Orchid	1890, Formby - Freshfield
<i>Cotula coronopifolia</i> * Buttonweed	mid-1980s, Southport Esplanade
<i>Isolepis cernua</i> Slender Club-rush	1914, Freshfield - Ainsdale
<i>Lycopodiella inundata</i> Marsh Clubmoss	pre-1900, Formby
<i>Pinguicula vulgaris</i> Common Butterwort	1914, Massams Slack
<i>Salvia verbenaca</i> Wild Clary	1870, Waterloo
<i>Selaginella selaginoides</i> Lesser Clubmoss	1954 - 1963, Formby - Birkdale
<i>Senecio erucifolius</i> Hoary Ragwort	No recent records
<i>Spiranthes spiralis</i> Autumn Lady's-tresses	pre-1900, Southport
<i>Zostera marina</i> Eelgrass	pre-1900, Crossens, Formby, Alt

Table 3. Vascular plants apparently not seen on the Sefton Coast since 1963 and possibly now extinct. (Introduced taxa are indicated with an asterisk)

Taxon	Last recorded
<i>Ambrosia pilostachya</i> * Perennial Ragweed	1958, Birkdale
<i>Armeria arenaria</i> * Jersey Thrift	1941, Ainsdale
<i>Carex paniculata</i> Greater Tussock-sedge	pre-1963, Freshfield-Ainsdale
<i>Carex viridula brachyrrhyncha</i> Yellow Sedge	pre-1963, Crosby-Southport
<i>Coronopus squamatus</i> * Swine-cress	1956, Blundellsands
<i>Cuscuta epithymum</i> Dodder	1915, Freshfield
<i>Dactylorhiza x wintoni</i> Hybrid Marsh-orchid	1949, Freshfield
<i>Epilobium x rivulare</i> Hybrid Willowherb	1954, Freshfield
<i>Erigeron speciosus</i> * Garden Erigeron	1951, Ainsdale-Birkdale
<i>Filago minima</i> Small Cudweed	1954-63, Formby-Birkdale
<i>Filago vulgaris</i> Common Cudweed	1930, Hillside
<i>Hieracium anglorum</i> Hawkweed	1954, Freshfield
<i>H. diaphanoides</i> Hawkweed	1951, Freshfield
<i>H. vagum</i> Hawkweed	pre-1963, Ainsdale-Birkdale
<i>Hordeum jubatum</i> * Foxtail Barley	1930, Birkdale
<i>Hyoscyamus niger</i> * Henbane	1959, Freshfield
<i>Juncus compressus</i> Round-fruited Rush	1933, Ainsdale
<i>Lactuca tatarica</i> * Blue Lettuce	1934, Freshfield
<i>Linaria dalmatica</i> * Balkan Toadflax	1954, Ainsdale
<i>Marrubium vulgare</i> * White Horehound	1930, near Ainsdale
<i>Myriophyllum alterniflorum</i> Alternate Water-milfoil	1932, Freshfield
<i>Onopordum acanthium</i> * Cotton Thistle	1910, Hall Road
<i>Oreopteris limbosperma</i> Lemon-scented Fern	1961, Freshfield
<i>Papaver argemone</i> Prickly Poppy	pre-1963, Crosby, Hall Road
<i>Potentilla argentea</i> * Hoary Cinquefoil	1956, Blundellsands
<i>Reseda alba</i> * White Mignonette	1927, Southport

Table 4. Native vascular plants identified on the Sefton Coast for the first time after 1963 (excluding *Rubus* microspecies).

<i>Allium scordoprasum</i>	Sand Leek
<i>Atriplex longipes x A. prostrata</i>	Hybrid Orache
<i>Betula x aurata</i>	Hybrid Birch
<i>Callitriche brutia</i>	Pedunculate Water-starwort
<i>Calystegia sepium roseata</i>	Hedge Bindweed (pink form)
<i>Crithmum maritimum</i>	Rock Samphire
<i>Dactylorhiza purpurella</i>	Northern Marsh-orchid
<i>Empetrum nigrum</i>	Crowberry
<i>Frangula alnus</i>	Alder Buckthorn
<i>Herniaria glabra</i>	Smooth Rupturewort
<i>Hieracium diaphanum</i>	Hawkweed
<i>H. exotericum</i>	Hawkweed
<i>H. sabaudum</i>	Hawkweed
<i>Juncus ambiguus</i>	Frog Rush
<i>Lathyrus nissolia</i>	Grass Vetchling
<i>Listera cordata</i>	Lesser Twayblade
<i>Mibora minima</i>	Early Sand-grass
<i>Orchis morio</i>	Green-winged Orchid
<i>Pimpinella major</i>	Greater Burnet-saxifrage
<i>Polypodium interjectum</i>	Intermediate Polypody
<i>Potentilla x mixta</i>	Hybrid Cinquefoil
<i>Primula veris</i>	Cowslip
<i>Pyrola media</i>	Intermediate Wintergreen
<i>Rosa caesia glauca</i>	Glaucous Dog-rose
<i>Rosa canina x R. sherardii</i>	Hybrid Dog-rose
<i>Rosa x dumalis</i>	Hybrid Dog-rose
<i>Rosa sherardii</i>	Sherard's Downy-rose
<i>Rumex x schulzei</i>	Hybrid Dock
<i>Salix x angusensis</i>	Hybrid Willow
<i>S. x forbyana</i>	Fine Osier
<i>S. x pontederiana</i>	Hybrid Willow
<i>S. x reichardtii</i>	Hybrid Willow
<i>S. x subsericia</i>	Hybrid Willow
<i>Schoenus nigricans</i>	Black Bog-rush
<i>Senecio x viscidulus</i>	Hybrid Groundsel
<i>Silene otitis</i>	Spanish Catchfly
